CHLOROACETALDEHYDE

Cl-CH₂-CHO. M.W. 78.5. Colorless liq. Sp. gr. 1.203. Uses—syntheses, due to its having a strong aldehyde reaction and a replaceable chlorine atom.

*Bios Labs, 17 W 60 St, N Y 23
Distillation Products Industries, 755 Ridge Rd W, Rochester, N Y
*Dow Chem Co, Midland, Mich
*Marathon Corp, Chem Div, Rothschild, Wis
*Westvaco Chem Div, 161 E 42 St, N Y 17

CHLOROACETAMIDE

ClCH₂.CO.NH₂. M.W. 93.50. White cryst. M.P. 118-119°C. B.P. about 225° with decomposition. Sol. 10 water, 10 absolute alcohol; sl. sol. ether.

*Chemical Development Corp, Endicott St, Danvers, Mass
*Distillation Products Industries, 755 Ridge Rd W, Rochester, N Y
*Dow Chem Co, Midland, Mich
*Fairmount Chem Co, 600 Ferry St, Newark 5, N J

o-CHLOROACETOACETANILIDE

$CH_3COCH_2CONHC_6H_4Cl$. M.W. 211.65. White, crystalline solid. M.P. 107°C. Insol. in water. Uses—mfr. azo dyes, including Hansa colors; intermediate in organic synthesis.

*Carbide & Carbon Chem Co Div, 30 E 42 St, N Y 17
*Distillation Products Industries, 755 Ridge Rd W, Rochester, N Y

CHLOROACETONE

CH_3COCH_2Cl. Chloroacetone contains an active ketone group and an extremely reactive chlorine atom. It finds application in the synthesis of many products such as pharamaceuticals, dyes, and other organic compounds. For example, Chloroacetone reacts readily with amines to form acetonyl-amines, with glycols to form chlorodioxolanes, with mercaptans to form sulfides or sulfur ethers, and with potassium formate to form acetol. Its purity is 85% to 90%, the remainder consisting almost entirely of unsymmetrical dichloroacetone. Chloroacetone is a very powerful lachrymator and will blister the skin on contact. Adequate precautions should therefore be taken in handling this product. Properties: B.P. 119°C at 760 mm. of mercury (pure material). Flash point, 42.2° C. (108°F). Sp. gr. 1.165 at 20°C/20°C. Wt. per U.S. gallon, 9.69 lbs. at 68°F. Refractive index, 1.4324 at 20°C. Coefficient of cubical expansion, 0.00110 per °C, 0.00061 per °F. Odor, strong, irritating (lachrymatory).

CHLOROACETOPHENONE (Phenacyl Chloride)

$C_6H_5COCH_2Cl$. M.W. 154.51. M.P. 59°C. Moisture less than 0.2%. Light brown crystalline solid. Uses—tear gas in cartridges, grenades and candles. Effective in concentrations as low as one part in three million of air. Grades—tech.

●Pkg—Cylinders.

*Bios Labs, 17 W 60 St, N Y 23
Distillation Products Industries, 755 Ridge Rd W, Rochester, N Y
*Dow Chem Co, Midland, Mich

CHLOROACETYL CHLORIDE

$CH_2Cl.COCl$. M.W. 112.9. Clear, colorless liq. with sharp odor. Very irritating to eyes and mucous membranes. Sp. gr. 1.459 at 0/4°. Wt. per gal. 12.5 lbs. at 0°C. B.P. 105.0 to 106.0°C. Decomp. in water and alcohol. Uses—mfr. chloracetophenone; in organic syntheses.

CLAYS, ENAMELERS'

Clays which are rather plastic and "fatty"—must be capable of floating the non-plastic enamel ingredients. This type of clay should be extremely pure and free from carbonates. There are several uses for this clay in enamels, one, for the ground coat, the other, the finishing coat. During the past few years a combination of domestic clays, including a very pure Florida clay has become very popular with the enameling industry.

CLAYS, FIRE

Chief object of this type of clay is to withstand excessive heats without deforming or melting. A true Fire Clay should withstand 3000°F. without running or melting in any way.

CLAYS

AMERICA'S LEADING PRODUCER OF WHITE CHINA CLAYS

CLAYS FOR THE PROCESS INDUSTRIES

Paper	Rubber	Leather	Ceramics
Protective Coatings	Plastics	Textiles	Insecticides
Adhesives	Ink	Paint	Pharmaceuticals

Electron microphoto of Georgia Kaolin Clay particles magnified 20,000 diameters.

USES

Absorbents, anticaking agents, bonding agents, brightening agents, coating materials, diluents, extenders, fillers, flatting agents, glossing agents, opacifiers, pigments, refractories, reinforcement agents, suspending agents, thickeners.

Georgia Kaolin's Clays are finely divided hydrated Aluminum Silicates which are non-toxic, non-abrasive, highly refined, chemically inert, insoluble, and non-hygroscopic.

Physical Properties

Characteristic crystalline form is flat, hexagonal plates ranging from .05 to 2 microns, equivalent spherical diameter, agglomerates, 2-30 microns.

Specific Gravity (Average)	2.58
Refractive Index	1.56
Hardness Moh's Scale	2

Colloidal Properties:

Readily deflocculated by common dispersing agents. Compatible with both aqueous and non-aqueous vehicles. Free flowing aqueous dispersion up to 72% and moderately plastic masses at higher solids.

Typical Chemical Analysis

Aluminum Oxide	38.28
Silicon Dioxide (combined)	45.20
Combined Water	13.87
Trace Oxides, approx.	2.50
Free Moisture	1.00

These clays are mined from special crudes carefully selected for specific product requirements.

PRECISION PROCESSING

All grades must pass rigid specifications set by the user's requirements before being released for shipment. Continuous and carefully controlled processing methods to produce standard and specialty grades for diversified purposes include degritting, fractionation to specific particle size ranges, bleaching, filtering, rinsing, and drying.

PRODUCTION GRADES

Standard Grades

Diversified use requirements are met by rigidly controlled processing of each grade at specified quality and price levels, within the over-all range of

Brightness (G. E. Meter)	78- 90%
Particles under 2 microns by weight	18-100%
pH value	4.2-7.2

To Meet Your Requirements

In addition to meeting individual specifications within the ranges indicated, clays are controlled for free moisture, chemical impurities, disintegrability, adhesive demand, hiding power, grit, viscosity and for ceramic grades, low shrinkage, high green and fired strength, uniform casting behavior.

PILOT PLANT AND RESEARCH

Georgia Kaolin Company continuously operates a complete modern pilot plant, together with special testing equipment, designed to study processing variables and to produce experimental clays for numerous applications.

BRING US YOUR PROBLEMS

Experienced research and technical counsel is available on problems relating to new and modified applications of these versatile materials.

Numerous important developments have resulted from this type of cooperative effort.

CLAYS, PULVERIZED-AIRFLOATED

The term given to clays (regardless of what type) which have been properly dried (to approx. 2%) then put through an Airfloating Mill. The term "Airfloated" usually applies to the milled clay which, after being extremely finely pulverized is blown by a blast of air upward to the hopper—hence the term "Airfloated" because it is "floated" in the air.

CLAYS, RUBBER-MAKERS'

Generally a white grit free domestic china clay, having some very definite functions when introduced in a rubber compound to perform—a good Rubber Clay should lend a certain stiffening to the finished product—it should have the ability to mix with the crude rubber very readily, and when used should become absolutely "part" of the compound itself. All china clays are NOT necessarily good rubber clays, and about the only true method of detemining one clay from another is by actual test, because the majority of china clays are not suitable for rubber due to the fact that they make for soft "flabby" products, rather than stiff, compact products.

CLAYS, SAGGER

This type of clay is usually made up of two or more tough plastic clays, one of the clays being rather strong tight burning and of the Ball Clay type, while the other should be rather open burning and refractory. The use of a Sagger Clay is for the making of receptacles in which ceramic products are placed when they are being fired or "cooked"—a Sagger in the pottery occupies the same position as a cooking-pot does in the kitchen.

CLAYS, TEXTILE

An unusually smooth grit free white domestic or imported china clay—having certain suspending properties. However, the most important factor is the amount of silica and grit contained—this is because the clay is used in the mfr. of certain types of cotton cloth and also as an ingredient in delusterizing baths for the rayon goods.

CLEANERS, BOILER-TUBE

Used to remove and prevent scale and rust in boiler tubes by neutralizing the sol. salts in the feed-water (largely carbonates of calcium and magnesium), precipitating them out of solution in form of colloidal sludge, which may be expelled from the boiler when it is "blown down." Ingredients include sodium silicate, trisodium phosphate, tannins, soda ash, sodium chromate, sodium alginate, starch, glucose, graphite, kerosene, barium compounds, etc.

CLEANERS, RUBBER

Products, usually in the liq. or semi-liq. state, used to remove dirt, grime, grease, stains, etc., from rubber floors, tile, etc. Should have no deleterious effect on the rubber; should leave the natural resilience but should not react chemically in such a way that the rubber becomes soft or plastic and easily scuffed.

DEL PROTECTIVE COATINGS

PROTECTED

means CORROSION PREVENTED!

A national study of the chemical process industry shows—

A 50% regard corrosive conditions as severe

B average plant is exposed to at least 3 types of corrosion

C 2 out of 5 plants average 5 important corrosive factors

Here are the facts!

- DEL Coatings protect metal, masonry, wood against acids, alkalies, water, oils, weather, high heat, abrasion.
- Independent case histories prove DEL superiority.
- DEL engineers and chemists continuously challenge corrosive agents in the laboratory and are constantly improving and developing new coatings to meet the problems of industrial progress.

Protection Assured—

... with DEL formulations of VINYLS, ACRYLICS, SYNTHETIC RUBBER, EPONS, SILICONES, PHENOLICS and other plastic resins — plus — DEL's amazing new SYNTHETIC RUBBER CAULKING COMPOUND.

Write today! Ask for complete DEL PROTECTIVE COATING information, color card and specific recommendations for your corrosion problems.

COLOR LAKES

Pigment consisting of an organic sol. coloring matter combined with an inorganic base or carrier and characterized by a bright color. There are three classes of color lakes: 1. Composed of hydrate of aluminum dyed with solution of natural organic color; 2. The more extensively used type made by precipitating from solution various coal-tar colors by means of a metallic salt, tannin, or other suitable reagent, upon a base or carrier either previously prepared or coincidently formed; 3. A number of lakes combining both types in varying degree.

COLOR LAKES, COSMETIC

Consists generally of suitable aniline colors precipitated on aluminum hydroxide, blanc fixe or other harmless substrata. These color lakes must naturally be extraordinarily free from such heavy metals as lead, arsenic, mercury, etc. Their tinctorial power is high. In lipstick and rouge they are employed almost exclusively. In face powd. for toning—, largely in eyeshadows—somewhat in creams but not often in liq. and lotions due to their tendency to bleed (run).

COLORS, EARTH

Natural pigments suitable for grinding in oils for paint mfr.—iron oxide is found widely distributed, usually in combination with alumina, silica, calcium, magnesium, manganese, and water. These ores usually have a brown, reddish-brown, red, yellow, or black hue. The brightest natural red iron hematite is found near the southern shores of the Caspian Sea and the refined pigment made from this ore is known as Persian Gulf Oxide. Deposits of iron manganese ores, having a rich brownish-green hue, were discovered on the Island of Cyprus and the refined product is marketed under the name of Turkey Umbers. Siennas are named after the Italian town of Sienna near where large quantities of bright yellow iron oxide are found. The finished products are marketed as raw and burnt grades. Veins of hydrated iron oxides are the raw material for ochres. Others in the group are the metallic browns and the iron magnetites (black oxides of iron). Iron oxide colors are also the siennas or umbers, either raw or burnt. Precipitated yellow oxides compete intensely with French, Indian, and African ochres. Calcined and precipitated iron oxides compete with the natural red hematites, such as Persian Gulf and Spanish oxides. Earth colors are employed in paints, leather finishes, in latex rubber, etc. See Siennas, Ochres, Umbers, Iron Oxide, Red; Iron Oxide, Yellow.

COLORS, GLASS

Liq. often containing resinates or similar organic compounds of various metals, the oxides of which form colors or pigments used for decorating pottery glass, tile, terracotta or similar ceramic surfaces. Another type of colors is that which consists of finely ground mixtures of pigments and low-melting glasses. This type is usually "fired" so that the color is directly incorporated into the finished article and is not simply a finish coat.

COLORS, INK

Dyes and pigments employed as the tinting agent. A limited number of water sol. dyes are used to make writing inks which contain water as the liq medium. Other dyes, sol. in glycerine, are used in stamping, copying, and hectograph inks. Still others, sol. in such organic solvents as alcohols, ketones, hydrocarbons, esters, acids, and aldehydes, are used to make aniline and intaglio printing inks. Very definite limitations are imposed on the choice of ink colors, such as pigment particle size, brilliancy, intensity, resistance to light, oil absorption, tinting strength bleeding, resistance, to the chemical action of the products they may come in intimate contact with, such as adhesive pastes, vinegar, wet soaps, waxed wrappers, alcohol, lard, ammonia, etc.

COLORS, LACQUER

Colors of low oil absorption, chemically inert, (mainly pigments) possessing good permanency, soft texture, great tinctorial strength and good hiding power. The colors are ground by various means in some ingredient of a lacquer and the paste so formed is then mixed into the remaining ingredients of the lacquer to produce a finished, colored lacquer.

COLORS, PAPER-MAKERS'

When max. whiteness has been obtained by bleaching pulp, paper manufacturers use blueing, such as ultramarine, and dyes, usually coal-tar anilines to tone the stock and offset any yellowness still remaining. These dyes, together with mineral pigments are employed to color the stock. The dyes penetrate the actual substance of the fibres. Pigments, however, color the stock by mechanical enmeshment with the fibres. See also, Dyes, Paper; Pigments, Paper. Pigments are less brilliant in hue than dyes, but are faster to light. If used in any quantity, they serve as fine fillers and have the same action as clay.

COLORS, PERFUME

Mixed coal tar dyes specially prepared to produce a wide variety of bright shades. Sol. in water and alcohol. It should be noted that very small quantities should be used, as their tinctorial power is so great that liq. in which they are incautiously used may stain.

COLORS, PLASTIC

Special pigments, earth colors or sol. dyes, usually added during either the mixing or the rolling operation, which resist heat, pressure, etc.; possess ability to dissolve in certain common solvents, and impart generally that transparency of color so desirable in plastics. Among the pigments are:—Prussian blue, zinc oxide, titanium oxide, carbon black, lampblack, cadmium and chromium colors; the earth colors, such as siennas, ochres, and umbers; the synth. dyes, such as triphenylmethane basic colors, many of the azo colors, certain of vat dyes, etc.

COLORS, RUBBER

Mineral pigments or synth. dyes (usually in the form of lakes, bound to a mineral base) not greatly affected by heat, steam, or sulfur: for white shades zinc oxide and the titanium pigments are largely used; for black, carbon black, lampblack, or one of the charcoal blacks; for blue, ultramarine is often used; chrome pigments, for green; zinc chromate is standard yellow pigment; cadmium sulfides are available in various yellow and orange shades; golden antimony, for orange shades, or ochres where color value at low cost is the deciding factor; for crimson shades iron oxide red, crimson antimony, and vermilions are widely used.

COPPER OXIDE
FOR INDUSTRY AND AGRICULTURE

CALUMET COPPER OXIDE
for Industry

Extensively used in
- **Paint and Pigment Manufacture**
- **Ceramic Coloring**
- **Base for Copper Chemicals**
- **Catalyst**

CALUMET BROWN COPPER OXIDE
for Agriculture

The new extraordinary Calumet **BROWN** Copper Oxide. Remarkable results established in three distinct agricultural fields:

- **As a Fungicide**
- **As a Soil Amendment**
- **As a Feed Supplement**

Proved as a nutritional spray or dust and used with safety in supplying nutritional copper in corrective or maintenance programs.

THE BROWN COPPER FOR BETTER CROPS

These copper oxides are of a chemically proven stable mixture of highly cuprous copper oxides, containing 75% metallic copper. Chemically produced under controlled conditions. Uniform in composition assuring consistent results.

DDT (Dichloro-Diphenyl-Trichloro-ethane)

$(ClC_6H_4)_2CHCCl_3$. Colorless cryst., M.P. 89°C. Sol. Freon, kerosene, hydrocarbon solvents; insol water. Technical DDT is a mixture of several isomers and reaction by-products, although the main constituent is 2,2-bis (p-chlorophenyl)—1,1,1-trichloroethane. The M.P. is consequently dependent upon the preponderance of the latter isomer, and some military specifications call for a higher setting point. Uses—insecticide active ingredient. Grades—tech. aerosol and purified. ●Pkg—Bags, drums.

DESIZING AGENTS

Sizes of the gelatine, glue, gum, oil, wax, paraffin, or starch variety, must be removed from fabrics before dyeing. Certain of these can be emulsified and removed by washing with a suitable detergent. Starch must be converted into a water-sol. compound and this is done with enzymatic products, which digest the starch, converting it into maltose. Other desizing agents are of the solvent type. See also Enzymatic Preps.

KREELON CD... *promoted detergent with over 40% active agents*

KREELON 4D and 4G... *40% minimum active agent*

KREELON 8D and 8G... *85% active agent*

Kreelon* is an efficient synthetic detergent and wetting agent. It *penetrates, spreads, emulsifies, disperses and cleans as it wets.* Its great value lies in its ability to function well in acid, alkaline or neutral solutions, and in hard or soft waters — either alone or in solutions and dry mixes with a great number of other chemicals.

DETERGENTS, TEXTILE

Specially formulated compounds prepared for cleansing textiles. Each type of textile fibre presents its own special problem. Textiles are washed at various stage of mfr. In recent years advances have been made in studying the peculiar requirements at each stage and in the accurate control of pH values, etc. Scientifically prepared products help to preserve tensile strength, provide better resistance to abrasive action, give whiter colors, assist in penetration of dyes, more level shades, etc.

DIATOMACEOUS EARTH

DICALITE FILTERAIDS — supplied in 12 grades for filtration of virtually any liquid in industrial processing, heavy and viscous or light and volatile. Used with pressure or vacuum filters to give brilliant clarity at fast flowrates. Send for Bulletin B-12 for complete details.

DICALITE MINERAL FILLERS — over 50 grades for filler uses in hundreds of products. They are light in weight, highly absorptive, chemically inert and afford extremely large surface area. More detailed data in Bulletin E-40.

HIGH TEMPERATURE INSULATION — supplied in powder and coarse grade for covering tops or filling wall spaces; calcined aggregate for loose insulation or for making insulating concrete. Send for a copy of Bulletin M-121.

Other products are Concrete Admixtures, Catalyst Carriers, Insecticide Diluents, and Conditioners for chemical fertilizers.

n-DIBUTYL ETHER

$C_4H_9OC_4H_9$. M.W. 130.14. Water-white, chemically stable liq. Mild ethereal oder. Misc. most common organic solvents. Water, dibutyl ether, mutually insol. and immiscible. Good solvent for a wide variety of substances, including ester gum, dammar gum, rosin, vegetable and essential oils, and for acetic, propionic, benzoic, salicylic and stearic acids. Not a solvent for nitrocellulose even in combination with alcohols. Sp. gr. 0.769 to 0.772 at 20°C./20°C. Dist. range, 130°C to 145°C, at least 90% between 138°C and 145°C. Uses—as extractant or precipitant in a variety of purification processes, and as a solvent medium in a variety of chemical syntheses.

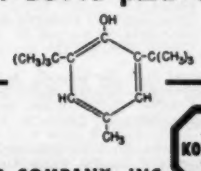
Quality Fine Chemicals

Stabilized Diazonium Compounds



N-alkyl and N-aryl stabilized salts of high purity are used as light-sensitive coatings on diazo-type papers. Try their unusual properties for new reproduction processes and organic syntheses.

The Ringwood Chemical Corporation manufactures organic chemicals of high purity and formulates chemical specialties.

Take advantage of Ringwood facilities for the confidential manufacture of intermediates and specialties for the chemical processing industries.

Eastman

dibutyl phthalate

Eastman dibutyl phthalate is a clear, colorless liquid with excellent light and heat stability. It is the most widely used plasticizer for cellulose nitrate and is particularly desirable in cellulose nitrate lacquers because of its high dilution ratio with petroleum naphtha. Available in drums, and in compartmented and full tank cars.

Sales offices in principal cities; see ad Catalog Section.

SILICONE DIELECTRICS

COATING AND IMPREGNATING VARNISHES developed during the past year increase still further the usefulness of Silicone (Class H) insulation with its 100°C temperature advantage over the best class of insulation previously known. Dow Corning 935 and 994 are used to coat glass cloth and sleeving and to bond mica-glass combinations. Dow Corning 997 impregnating varnish has greatly improved dielectric properties and reduces processing time for Class H equipment by 50 to 75%.

Dow Corning 4 Compound is a waterproof, non-melting insulating paste for sealing ignition and electrical control systems; and for sealing disconnect junctions in radio, radar and other high frequency equipment. Dow Corning 4 Compound meets Specification AN-C-128a.

Dow Corning 200 Fluids are generally superior to other liquid dielectrics and are relatively unaffected by frequency or temperature changes. Semi-vulcanized Silastic* R Tape is applied to coils and cables and then cured to form a void-free, moisture-proof and oil-resistant jacket with good dielectric properties and high thermal conductivity, Silastic insulated wire and cable, exceptionally resistant to corona and to both mechanical and electrical fatigue, is an excellent lead wire for electric ovens, furnaces and motors, and for power plant wiring and high voltage ignition and neon sign cable.

DILUENTS, LACQUER

Active resin solvents which assist in the blending and compounding of specific resins with the nitrocellulose, cellulose, or other ingredients, thus modifying flow and vaporization characteristics. The more commonly used are benzol, toluol, xylol, various organic solvents, and petroleum solvents, specially fractionated for the lacquer industry. Products are specially treated in order that traces of objectionable nauseous odors are removed, as well as corrosive constituents. Grades—Light Fraction: This is used to replace benzol, all or in part, in fast drying lacquers. Rate of evaporation is similar to that of benzol. Medium Fraction: This is used to replace toluol, all or in part, in spraying lacquers for the automobile and furniture trade. Rate of evaporation is similar to that of toluol. Heavy Fraction: This is used to replace xylol, all or in part, in slower drying lacquers. Rate of evaporation is similar to that of xylol. Very Heavy Fraction: This is used in brushing lacquers for the architectural field. Evaporation rate is roughly similar to that of turpentine.

DIMETHYLOL UREA

$HOCH_2NHCONHCH_2OH$. A water sol. primarily condensation product of urea and formaldehyde of particular interest as a resin intermediate. Useful in protective coating, adhesive, and impregnating compositions and in the modification of natural and synth. products. Water content less than 11%. Water solubility 15% at 20° C., 45% at 50°C. Generally insol. in organic solvents.

dioctyl phthalate

Eastman DOP is uniform in quality and has unusually low color. DOP is probably the best all-purpose plasticizer known for polyvinyl resins and also finds use with a wide variety of other materials, including polymethyl methacrylate, the cellulosics and synthetic rubber. Available in drums, and in compartmented and full tank cars.

KOPPERS

Diphenylaminechlorarsine

● "DM" is a crystalline organo-arsenic compound, which, as an organic arsenical, is toxic to many of the lower forms of animal life. It is a sternutator and a skin irritant, and is used as a component of tear-gas devices and in the formulation of wood-treating solutions for protection against such pests as marine borers of the genus Teredo.

$(C_6H_5)_2CO_3$. M.W. 214. White crystalline solid. M.P. 78°C. B.P. 302°C; 168°C (15 mm). Insol. in water, sol. in hot alcohol, ether, acetic acid, acetone, and most aromatic solvents. Volatility of 22.0% compared with 100% for camphor. Compatible with cellulose acetate, effecting ready solution to form a clear and uniform plastic comparable to that formed with camphor. It is similarly recommended for ethyl cellulose plastic. Forming odorless and less combustible plastic with nitrocellulose, it lends itself for substitution of up to 50% of the camphor content of such plastics.

DISCHARGE AGENTS, TEXTILE

Usually a reducing agent most common of which is sodium hydrosulfite. Used to reduce the ground color in discharge printing on silk, cotton or rayon fabrics, as an ingredient in vat dyeing and as a stripper to remove dyestuffs from fabrics for redyeing. There are several proprietary products for special stripping purposes where hydrosulfite is ineffectual or unsuitable.

DISINFECTANTS, COAL TAR

Coal tar disinfectants owe their potency largely to the phenolic compounds they contain and are made in emulsion and sol. types. The emulsion type is made from tar acid oils, soaps (frequently rosin soap) and water, and when diluted for use in water form whitish emulsions. They are mfr. with phenol coefficients ranging from 2 to 20. The sol. type is made from tar acids, usually cresols and xylenols, soap, alkali and water and from clear or sl. analescent solutions when diluted with water for use. Liquor cresolis compositus U.S.P. XI is a soluble type disinfectant made according to the specification of the U.S. Pharmacopoeia. The Bureau of Animal Industry (B.A.I.) type is another example of the sol. type coal tar disinfectant.

KOPPERS
Divinylbenzene
DVB, 40-50% DVB, 20-25%

● Divinylbenzene is useful as a starting material for the preparation of specialty copolymers and resins. Divinylbenzene is used for the production of "super processing" GR-S synthetic rubbers, for potting and laminating resins, for modified drying oils, for synthetic ion exchange resins, and for making polymer carbon.

DYES, BASIC

Derived from ammonia by replacement of one or more hydrogen atoms of one or more molecules of ammonia with various other elements or groups of elements. Basic in character, hence the name. Combines readily with silk and wool without aid of mordants, producing brilliant shades. Uses—on leather, paper and various textile fibers.

DYES, CHROME

Intermediate in character between acid and mordant colors. Resemble acid colors in that they may be dyed directly upon wool in an acid bath and at the same time resemble the mordant colors in that they may be dyed upon metallic mordants. Uses—extensively on men's and women's wear. Possess good fastness to light, acids, washing, perspiration, spotting, etc.

DYES, COTTON

Dyes for cotton include the direct or substantive dyes which are water sol. products that dye cotton directly without the use of a mordant; the basic dyes which are water sol. dyes but which require that the cotton be first mordanted, usually with tannic acid and antimony salts; the sulfur dyes, insol. in water but sol. in sodium sulfide, from which solution they dye cotton directly; the vat dyes, insol. in water but sol. in caustic soda and sodium hydrosulfite. The vat dye solution possesses a direct affinity for the cotton and, by subsequent oxidation, reproduces the original insol. form of the dyestuff. In general the vat dyes possess the best fastness to washing and light; the direct dyes in general are of moderate to fair fastness to washing and from moderate to very good fastness to light; the basic dyes are poor in light fastness but are extremely bright; more so than any other class of cotton dyes; the sulfur dyes may be considered as being faster than the direct dyes but not as fast as the vats. Many of the direct dyes can be after-treated with metallic salts or with formaldehyde with a consequent increase in fastness either to light or to washing. Another group of direct dyes, commonly called development dyes, are applied in a similar manner to the usual direct dyes but, by subsequent diazotization and development, yield shades rather faster to washing. Another group of dyes for cotton is the Naphthol dyes, generaly of good fastness to light and washing. These dyes are formed directly on the fibre itself.

DYES, LACQUER

Dyes sol. in lacquers. By incorporating them, various colored but transparent lacquers are produced. Their use over metal, paper, etc., gives pleasing effects as the transparent lacquer allows the finish of the base material to show through. For suppliers see Dyes, Resins.

DYES, LEATHER

Basic, acid, direct, chrome and developed dyes are used on leather. Basic dyes are used on all types of leather and require a vegetable tannage as a mordant; they are also used for topping acid, direct, chrome and developed dyes, where strength and brightness are required. Acid dyes are used on all classes of leathers and tannages where level dyeing is required. The exceptionally soluble acid dyes are used where penetration is desired, as on suedes which are buffed after dyeing. Acid dyes also are used in finishes for grain leathers and edge inks. Direct dyes are surface dyeing dyes and are used principally on chrome leathers, also in combination with acid dyes and chrome dyes. Chrome dyes are used in the same manner as acid dyes on both chrome and vegetable tanned leathers. Developed dyes are used on chrome tanned leather where very good fastness to washing is required.

DYES, MIXED FIBRES, COTTON & RAYON

Cotton dyes, usually the direct or substantive type, are used for dyeing cotton and rayon fabrics. Since both of these fibres consist of cellulose and differ in their affinity for dyestuff, considerable care must be taken to select dyes and to conduct the dyeing operation so that a shade as uniform as possible will be obtained on both fibres.

DYES, PAPER

Specialized dyes added to the pulp and fixed either by direct absorption or by precipitation. There are three general classifications:—1, Basic dyestuffs (precipitated in combination with acids); 2, Acid dyes (precipitated in combination with certain bases); and 3, the so-called "cotton" dyes which are readily absorbed by the cellulose fibres. Natural Dyestuffs, such as Logwood, Sap Brown, etc., are also used. See also Pigments, Paper; Pigments, Blue, Red, Yellow, Brown; Mineral, Chemical, etc.

DYES, RAYON

Rayon is dyed using the same dyes as cotton. The direct dyes are used where simplicity of application is desired or where fastness requirements are not severe. Sulfur and, more particularly, vat dyes are used whenever the best fastness is desired.

DYES, RESIN

Molded plastics are colored with dyes from the various groups, especially selected to withstand the heat and the various chemicals used to disperse or dissolve readily during molding and to possess the necessary fastness properties. Cast resins are dyed with dyes especially selected from the various dye groups in regard to solubility in the resin and ability to withstand the reducing action in the kettle.

DYES, SPECK

Speck dyes consist of direct dyes which possess a marked affinity for cotton and other forms of vegetable matter and little if any for wool. They are principally used to cover up specks of cotton, etc., in woolen fabrics without changing the shade of the wool.

DYES, WOOL

Wool ordinarily is dyed with acid dyes or chrome dyes. The acid dyes are used in piece dyeing ladies' dress goods where brightness of shade, level dyeing, moderate-to-good light fastness are the principal requirements. They are easily and quickly applied. Where particularly good fastness to washing, fulling and light are desired the chrome dyes are used. These are more expensive to apply as they require a longer time than the acid dyes.

KOPPERS
POLYSTYRENE EMULSIONS

● Useful in the production of paints, protective coatings, reinforced plastics, and paper coatings. Available both with and without plasticizers. Plasticized polystyrene emulsions will form continuous films when dried down at room temperature. Unplasticized, they dry down into fine white powder with little tendency to coalesce.

ENAMELS, ACID-RESISTING (Enamels Defined)

Official A.S.T.M. definition "A special kind of paint which flows out to a smooth coat when applied and dries to a smooth, glossy, relatively hard, permanent solid when exposed in a thin film to the air. An enamel always contains a pigment and has considerable hiding power and color. Some enamels dry to a flat or eggshell finish instead of a gloss finish." Specially prepared enamels because of certain ingredients exhibit the characterisic of being very acid resistant.

ENAMELS, CONCRETE

Specially formulated enamels for application to concrete, masonry, brick, etc., to give semi- or full-gloss finish and a protective coating. Should be particularly impervious to water acids, alkalies, etc. Largely used on concrete floors. Should wear well, should not crack or chip and should stand up under repeated washings. Some products in this classification are formulated with a rubber base.

ENZYMES

Catalysts of organic and usually colloid nature having a specific action. They are formed by living cells but are usually independent of the presence of the latter in their operation. Uses—produce hydrolysis (decomp fats, convert aldehydes into a mixture of acid and alcohol, invert sugars, digest proteins), coagulate (clot blood, curdle milk), reduce or decomp. (lactic acid and alcohol fermentations), oxidize (convert alcohol into acetic acid.)

ETHYL ETHER

Clear colorless extremely volatile liquid with ethereal odor. An excellent solvent for many organic compounds. Used in the extraction of fats, oils and alkaloids, and in the recovery of acetic acid from dilute water solutions. With alcohol it is an excellent solvent for nitrocellulose. Source for pure ethylene.

ISOPROPYL ETHER

Clear colorless liquid with ethereal odor. It has a higher boiling point and a lower vapor pressure than ethyl ether and acetone. Excellent solvent for animal, vegetable and mineral oils, fats, waxes and resins. Because of solvent and low vapor pressure properties it is valuable as an extracting agent. Other uses are: partial solvent for oil soluble dyes, ethyl cellulose solvent, and with alcohol in the formulation of nitrocellulose lacquers.

ethyl acetate

This fast-evaporating Eastman solvent is excellent for use in lacquers, varnishes, paints and pyroxylin plastics. It also finds wide use as a pharmaceutical and chemical intermediate.

Normal denaturant is ST-115 with special denaturants supplied on request. Sold in drums, and in compartmented and full tank cars.

Sales offices in principal cities; see ad Catalog Section.

EXTRUDING COMPOUNDS

Synth. resin plastics which are not compressed or hardened in a closed mold, but which are treated in a mold open at the inlet and outlet sides. With increasing pressure the mass passes from the solid to the plastic state, and is then gradually hardened, all the time being in periodical or continual motion. On the discharge side of the extruding machine special devices are used to form the material as it emerges into various shapes. For suppliers see Molding Powders Plastic.

FAT LIQUORS

Process of "fat-liquoring" comprises three distinct operations: coloring, filling, and oiling, but often all are done in one step. Fat-liquoring proper consists of filling leather with soaps, oils, starch, china clay, tallow, egg yolk, and a number of other materials to strengthen the fibres and render the leather soft and pliable, at the same time giving it the desired color. Process is usually carried out at a high temp. in the drum tumbler and changes the leather to black or colors. Prepared fat-liquors are scientifically compounded products containing a wide variety of substances, depending upon the producer and the type of leather to be processed.

FATTY ACID ESTERS

Various esters of the fatty acids, such as stearic, oleic, linoleic, ricinoleic, etc. The fatty acids are produced by the removal of the glyceride content from neutral oils and fats, either by chemical or mechanical means. The resultant fatty acids are then distilled under vacuum of varying degrees and varying temp.

FILLERS, MASONRY

Heavy coating compositions, often composed of waterproof oil, asbestos fibre and paint pigments, which are applied with a brush or by other mechanical means to exterior surfaces, principally of brick, concrete, or stucco, to place a waterproof coating on porous or leaky walls. Coatings of this type will bridge small cracks, fill in the pores, and, as they come in colors, may be used for decorative purposes also.

FILLERS, PAPER

Except in high quality papers it is customary to add to the pulp a relatively cheap mineral loading material to provide bulk and also in many instances to help fill the pores. Most commonly used, and often called "loaders" are; china clay, clays, calcium sulfate. See Clays, Paper-Maker's; also Kaolin, China Clay, Calcium Sulfate, etc.

FILLERS, PLASTIC

The use of filling materials, which include cellulose, asbestos, fabric, paper, etc., is for the value given by the special properties of these materials, better molding qualities, greater toughness and strength, and, in the case of mineral fillers, an increased degree of water and heat resistance. Wood flour is one of the most common of fillers employed. Further, mineral filled molding materials also have a lower coefficient of heat expansion and lower shrinkage in the molding operation which in some instances is an advantage. See also pitches of various types.

FILLERS, WOOD

Pastes or liq. specially for sealing wood surface to make it smooth and fill the cellular spaces so that the succeeding finishing coats will not penetrate but will provide a surface finish. Pastes are often used for all open-grained woods, such as oak, ash, chestnut, while liq. are preferred for close-grained woods, such as pine, fir, gumwood, and cypress. Fillers should also aid as a bond between the wood and the finishing coats.

FILTERAIDS and FILLERS

DICALITE FILTERAIDS—used in conjunction with pressure and vacuum filters of all kinds in clarification of chemicals, food products, oils, varnish, beer and wine, pharmaceuticals and antibiotics, sugars, waxes and many other products. The unique structure of the diatom particles forms a filter cake having finer yet greater porosity. Suspended solids are removed to give brilliant clarity. Flowrates are fast for high level output. Quality of product is maintained and production costs lowered.

MINERAL FILLERS—inert, light in weight, highly absorptive and having very large surface area. Supply bulk without material weight increase; add strength, toughness and resistance to abrasion; improve elasticity and reduce brittleness — according to product in which used. Over 50 special grades supplied for paints, paper, polishes, asphalt compounds, plastics and many other products.

Dependable GREAT LAKES Dicalite® DIATOMACEOUS MATERIALS

FILTER AIDS Celite® MINERAL FILLERS

Celite Filter Aids, the original diatomaceous silica filter powders, provide efficient, low-cost clarification in filtering of numerous liquids ranging from sugar and syrups to drugs and lubricants. Available in many standard grades to provide any desired degree of clarity at the highest rate of flow.

Celite Mineral Fillers have been developed in varying grades for many industrial processes. They provide such product improvements as added bulk, reduction of gloss, increased hardness and toughness, removal of stickiness, control of body, higher melting point, improved dispersion, etc.

FIREPROOFING COMPOUNDS, FABRIC

Specially formulated compounds that emit flame-quenching vapors, that deliquesce, or readily fuse and protect the fiber from combustion by excluding air. Usually contained in the formulae are: boric acid or borates, and ammonium phosphates or sulfates. Where laundry-fast flame-proofing agents are required the insol. stannates and tungstates are usually employed.

FIREPROOFING COMPOUNDS, WOOD

Chemicals or specially prepared combinations of chemicals which when applied to wood will not actively support combustion, thus preventing the wood from bursting into flame, but charring instead. In most cases the chemicals used to impregnate the wood when heated emit a smothering gas or composition of gases which will keep oxygen from air from supporting combustion.

For greater productivity and more effective separation, investigate Armour's specification chemical reagents.

Armour's cationic reagents include ARMEENS (high molecular weight aliphatic amines), ARMACS (their water-soluble acetate salts), and ARQUADS (quaternary ammonium salts). Armour's anionic reagents are NEO-FATS (special fractionally distilled fatty acids). All are available in commercial quantities. For technical advice and samples, write:

FLUXES, WELDING

Welding fluxes in the form of powd. are used in welding certain metals. In general, the purposes of fluxes are as follows:—1. To float all impurities to the surface of the molten metal; 2. To cleanse the weld by chemical action; 3. To protect the molten metal against oxidation by contact with the air, and to dissolve any oxide that may have existed in the metal at the weld; 4. To aid fusion, between the molten metal from the filler rod and the metal being welded. In the welding of steel castings, plates and wrought iron, no flux is required ordinarily, but the use of the proper flux when welding with cast iron, bronze, brass, copper and aluminum is essential only from the standpoint of weld quality, but is economical in speeding up the rate of welding.

Borden's FORMALDEHYDE

now available from these 3 "next door" plants:

Look up "Borden's" next time you need formaldehyde.

If you're inside one of the 300-mile circles shown above, Borden's can probably deliver your formaldehyde by tank truck. Fast service and frequent service, so that you don't need large storage tanks.

If you're outside the circles, get Borden's prices on tank car (6,000-gallon "Split cars,"—8,000 or 10,000-gallon full cars) and drum shipments.

TYPES AVAILABLE:

37% inhibited (also known as "Formalin," "U.S.P." or "N. F." formaldehyde). Shipped in tank cars, tank trucks, drums.

37% uninhibited. Shipped in tank cars or tank trucks.

44% inhibited or uninhibited. (Shipped in tank cars or tank trucks from Bainbridge, N.Y. or Demopolis, Alabama only.)

Borden's formaldehyde is made in completely modern, automatic equipment that assures uniformity of quality and trouble-free formulating in your plant. It's made to meet your specifications for acidity, methanol content, etc.

Write, wire or phone for a quotation. Address: *The Borden Company, Chemical Division, 350 Madison Avenue, Dept. CW-93, New York 17, N. Y.* H.3.1

FLOREX

Highest quality Fullers Earth, produced by America's oldest manufacturer. Granular and fine particle sizes to specification. Adsorptive capacity greatly increased by Floridin high-pressure extrusion process. Effective for all adsorbent purposes, including decolorization, clarification, neutralization, desiccation, extraction, catalysis, diluent and other uses. Adsorption problems welcomed by competent technical staff. Samples available.

GASOLINE ANTI-KNOCK COMPOUNDS

Products added to gasoline to correct the tendency of a fuel to "knock" or detonate. The phenomenon known as knock, or detonation, is caused by an abnormally rapid pressure rise or explosion within the engine cylinder. This violent combustion delivers a hammer-like blow to the piston head and combustion chamber walls. Aside from the disagreeable sound produced when a fuel is knocking, a serious loss in engine power results. The anti-knock characteristics of a fuel can be improved by either adding another fuel of higher quality (alcohol, toluol, benzol, etc.), or by the addition of a knock suppresser.

GELATIN

Edible gelatin is a purified protein obtained by hydrolysis from collagen-bearing tissue of food animals. Must comply with pure food laws of the U.S. and with laws established by certain of the states. Is a typical example of a reversible colloid of the emulsoid type. Chief characteristic is ability to form a jelly when dissolved in hot water and allowed to stand until cold. Has yellowish tint and is furnished in ground form, sheets or flakes. Is sol. in hot water; insol. in alcohol,

GLYCOL DIACETATE

$C_6H_{10}O_4$. M.W. 146.14. Water-white liq. B.P. 186°C. Uses—solvent for cellulose esters and ethers, for printing inks and lacquers, and for resins; plasticizer; perfume fixative; prevents blushing in airplane dopes; imparts flexibility to cellulose ether films.
● Pkg—1 gal. cans, 5, 55 gal. drums.

GLYCOL DIFORMATE (Ethylene Glycol Diformate, Ethylene Formate)

$HCOOCH_2CH_2OOCH$. M.W. 118.09. As supplied commercially is a mild-odored, water-white liq. sol. in water, alcohol, and ether. This ester boils at 177°C. under 760 mm. pressure and has a specific gravity of 1.2240 at 20/20°C. Like glycol diacetate, it is solvent for cellulose acetate, nitrocellulose, and cellulose ethers. In the presence of water, glycol diformate will hydrolyze slowly with the liberation of formic acid. Hence, it can be employed in reactions where it is desired to develop a gradual source of this acid. It shows promise as an ingredient of embalming fluids.

GREASES, CUP

Usually lime or soda soap greases, made in a wide range of consistency, according to the relative percentages of mineral oil and soap in them and the viscosity of the mineral oil employed. Should be free from fillers, but may contain graphite. Usually produced by mixing mineral oil with a calcium soap to give a desired "body" or "consistency." Most cup greases contain from 1 to 3% water.

GREASES, WATERPROOFING

Heavy, plastic grease usually employed to seal and lubricate automobile waterpump bearings and packing glands. Also greases of various formulation, but usually of a calcium base with graphite incorporated or some modification that does not melt or dissolve in hot water. Soda base greases wet-out readily, but are very sol. and work into soapy emulsions when used in the presence of moisture.

Eastman

hydroquinone
(TECQUINOL)

Tecquinol (Eastman technical hydroquinone) is an economical raw material for many organic syntheses. With amines, it yields p-aminophenols and p-phenylenediamines of high quality. It is very useful as a polymerization inhibitor for many monomers, and is a most satisfactory arrester for peroxide-catalyzed polymerizations. Available in fiber-drum lots.

Sales offices in principal cities; see ad Catalog Section.

INHIBITORS, CORROSION

Variety of products used principally in the art of pickling iron and steel in various forms; to remove scale. Addition agents in acid solutions to control or prevent solution of metals. Some advantages of use of inhibitors are:—economy of acid and steel; reduction in the embrittlement effects of diffused hydrogen in the steel itself; in certain cases a large reduction in the fume or spray from the pickling tanks; reduction in maintenance costs.

INSECTICIDE BASES

An insecticide is defined in the Insecticide Act of 1910 as "any substance or mixture of substances intended to be used for preventing, destroying, repelling or mitigating any insects which may infest vegetation, man or other animals or households or be present in any environment whatsoever." A few materials, such as sulfur dust, have both insecticidal and fungicidal value. Among the more common insecticides and fungicides are the arsenicals (Lead Arsenate, Calcium Arsenate, Paris Green, White Arsenic, Sodium Arsenite Solution); sulfur compounds (Calcium Monosulfide, Lime Sulfur, Sulfur Dust); oils and organic compounds (Kerosene, Creosote Oil, Mineral Oil Emulsions, Petroleum Oil, Naphthalene, Paradichlorbenzene); Pyrethrum, Nicotine Sulfate, Derris, Cube. More important fungicides are Copper Sulfate, Zinc Chloride, Sodium Fluoride. Other products employed in the insecticide and fungicide fields include: Zinc Arsenite, Magnesium Arsenite, Magnesium Arsenate, Arsenical Cattle Dip, Copper Carbonate, Cryolite, Ethyl Mercuric Chloride, Pine-Tar Oil, Coal Tar Distillates, Acid Hydrocyanic, Carbon Disulfide, Ethylene Dichloride, Ethylene, Oxide, Calcium Cyanide, Sulfur Dioxide, Fluosilicates, etc.

WYANDOTTE CHEMICALS

AGRICULTURAL INSECTICIDES

Dichlorodiphenyltrichloroethane (DDT)

Benzene Hexachloride (BHC)

DDT—for formulation into aerosols, solutions, emulsions, dusts, or wettable powders for the control of insects affecting public health, agriculture and industry.

BHC—effective in the control of a number of agricultural insects such as aphids, cotton insects, and soil insects. Widely used in the control of migratory locusts and as an insecticide for the control of insects affecting man and animals.

Samples and data available on request.

GE silicone INSULATING RESINS

G-E silicone insulating resins provide a new class of electrical insulation. This Class H insulation permits continuous operation of electrical equipment at a hot-spot temperature of 180 C—that is, 75 C above the operating range offered by conventional insulating materials.

Applications: Treating glass and asbestos fabrics for cell wrappers, slot liners, phase, core and end insulation; bonding and impregnating motors, generators and transformers. G-E silicone insulation is indicated wherever these conditions are encountered:

- High operating temperatures
- High ambient temperatures
- Alternating high-low temperatures
- High overloads (withstands 200-250 C for short periods)
- Excessive moisture
- Where "down time" is critical
- Where smaller and lighter units are required

For more information, write to General Electric Company, Section 355-3H, Waterford, New York.

INSULATION MATERIALS

Four mineral products—asbestos, magnesium carbonate, diatomaceous earth and rock or mineral wool and also waste products of vegetable origin are among the principal raw materials out of which insulation materials are produced. Insulation is commonly supplied in the form of sectional pipe covering; insulating sheets, blocks, bricks, and blankets; insulating cements, fillers, and finishes; insulating papers and felts; as well as lightweight aggregate used with Portland cement for making insulating concrete. See also Fillers, Insulating.

CARBONYL IRON POWDERS

Remarkably pure form of iron produced by heating iron pentacarbonyl to a temperature where it decomposes into iron in powdered form, liberating CO. Iron particles formed are all spheres, essentially free of non-ferrous metals. Produced in various particle sizes at Grasselli, N. J., and Huntsville, Ala.

Eastman

isopropyl acetate

Eastman isopropyl acetate offers the lacquer formulator a low-cost solvent similar in properties to ethyl acetate. Because of its higher boiling range, it evaporates more slowly and is therefore in demand for blush-resistant formulations. Its good solvent properties make it a versatile material for the chemical process industries. Available in drums, and in compartmented and full tank cars.

Sales offices in principal cities; see ad Catalog Section.

LIME, HYDRATED (Calcium Hydroxide, Calcium Hydrate, Staked Lime)

A dry powder obtained by treating quicklime with water enough to satisfy its chemical affinity for water under the conditions of its hydration. It consists essentially of calcium hydroxide or a mixture of calcium hydroxide, magnesium oxide and magnesium hydroxide. Its principal chemical uses are in general the same as listed under lime (Quicklime). The A.S.T.M. specifications mentioned under quicklime also cover hydrated lime in most instances. Hydrated lime is shipped in numerous sizes of paper and cloth bags (50 pounds generally) and also in bulk to water treating plants and other users of large quantities. Regular and superfine terms are used to designate differences in the fineness or particle size of hydrated limes.

LIME, QUICKLIME

A calcined material, the major part of which is calcium oxide or calcium oxide in natural association with a lesser amount of magnesium oxide, capable of slacking with water. Contains also small quantities of silica, iron and aluminum oxides, and other impurities. Quicklime is produced by burning limestone or dolomite in shaft or rotary kilns. When exposed to the air for a considerable period of time, quicklime will absorb moisture and carbon dioxide. It first changes to calcium hydroxide, or hydrated lime, and later the exposed portion will unite with carbon dioxide from the air to form calcium carbonate, and thus the lime will lose some of its chemical activity for certain purposes. To prevent deterioration in storage quicklime is packed in steel drums or tight wooden barrels containing 180 or 280 lbs., and in waterproof multiwall paper bags or paper-lined burlap bags containing amounts of quicklime which vary among the different companies, usually about 80 lbs. Quicklime is shipped also in bulk. Its principal chemical uses include the following—as a fluxing agent, and for wire drawing, pickling, annealing, and pig casting in the iron and steel industry; for causticizing, and the manufacture of bleach, paper filler, by-products from waste liquor in the paper industry; as a softening agent, corrosion corrective, and for iron, color, and objectionable gas removal in water treatment; as an important ingredient in the maufacture of soda-lime glass; for dehairing hides in the leather industry; as a raw material in the manufacture of calcium carbide and calcium cyanamide; in the processing or manufacture of sand-lime brick; silica brick; sugar; insecticides, fungicides, and disinfectants; glue and gelatin; sodium bicarbonate and soda ash; paint pigments; varnish; lubricating greases; textiles; dyestuffs and intermediates; and for the treatment of sewage and trade wastes.

LIQUEFIED PETROLEUM GASES

Principal members of the group are: ethylene, propane, butane, isobutane, propylene, butylene. Butane is used for enriching water gas; as a base material for manufactured gas; in connection with butane-air distribution from central stations where manufactured or natural gas is not available. Propane is widely used for so-called "bottled service," for country residences, etc. Butane is used for commercial heating in plants. Ethane is sometimes used as a fuel. Ethylene is used for ripening fruit and as an anaesthetic. Propylene and butylene are used in organic synthesis.

LITHIUM CHLORIDE

APPLICATION

Chemical Manufacturing: Starting material for production of lithium metal through electrolysis of the fused chloride.
Heat Treating: Used for both salt bath and atmospheric, for lowering eutectic temperature.
Welding: Used in the manufacture of welding fluxes for aluminum and magnesium. Has marked affinity for the oxides of Aluminum and Magnesium, as well as considerable fluxing power.
Air Conditioning: Normally used as 40% brine for dehumidification, absorbing moisture from the air.
Dry Cell Batteries: For lowering operating temperatures.
PACKING—Technical powder: fiber drums—350, 100 and 25 lbs. net weight.
Brine: steel drums—550 lbs. net weight.

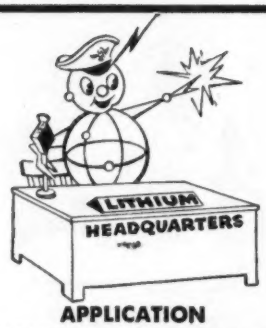
LITHIUM HYDROXIDE



APPLICATION

Pharmaceutical And Chemical Manufacturing: A strong base, similar to sodium and potassium hydroxide. Used in preparation of other lithium salts where use of carbonate is not feasible. Used in the preparation of lithium soaps, greases and waxes.
PACKING: Steel drums—375, 100 and 25 lbs. net weight. No shipping regulations.
Write Dept. G for Data Sheets.
Rely on "L. C. A." as a dependable source of supply for Lithium in any form.

LITHIUM METAL

APPLICATION

METALLURGY: As a degasifier, deoxidizer, desulfurizer and general purifying agent.

Organic Chemistry: Organic synthesis of the Grignard type, particularly where the magnesium Grignard reacts sluggishly or in poor yield. Also used for the preparation of organometallic compounds of other metals.

FORMS—Cup . . . 1/5 lb. . . . Shot . . . 4-8 mesh . . . Extruded Rod . . . ½" & ⅜" dia. . . . Wire . . . ⅛" dia. . . . Ribbon . . . ¼" . . . Cartridge (encased in copper tubing) . . . 2.25, 4.50 & 9.0 gram.

PACKING—Metal drums under oil.

LITHIUM HEADQUARTERS

. . . your best single source of supply for Lithium Salts and Lithium Metal in experimental or commercial quantities.

4 FACTORS Give "L. C. A." Strictest Product Control Over Quality Of Their Lithium Metal And Salts:

1. Company owned ore deposits and concentration facilities.
2. Complete chemical processing and electrometallurgical plant.
3. Extensive research facilities.
4. Exclusive attention to Lithium—its research, development, production and application—for industry.

Rely on "L. C. A." as a dependable source of supply for Lithium in any form. Our extensive ore deposits, concentration facilities and Lithium "know-how" make "L. C. A." your logical supplier for Lithium metal or salts.

SILICONE LUBRICANTS

Dow Corning Silicone Fluids are notable for their relatively constant viscosity over a wide temperature range, heat stability, inertness, low volatility, high flash and fire points, low freezing points and water repellency. Dow Corning 200 Fluids are good lubricants for rubber, plastics and certain metal combinations in small synchronous motors, precision machinery and instruments. Dow Corning 550 and 710 Fluids are used as permanent lubricants for instruments, clocks and other devices operating at high and low temperatures.

Dow Corning Silicone Greases are characterized by exceptional heat stability and oxidation resistance, low bleed and evaporation, and freedom from gumming or sludging. Dow Corning 33 Grease is serviceable from —100° to 300°F. in ball bearings with speed factors up to 200,000; Dow Corning 44 from —40 to 400°F. in ball bearings with speed factors up to 225,000; Dow Corning 41 from —20 to 400°F. in ball bearings with speed factors up to 75,000. Dow Corning Stopcock Grease is designed for general laboratory use; Dow Corning High Vacuum Grease for ground glass joints in high vacuum systems; and Dow Corning Valve Seal A for pressure lubricated valves exposed to extreme temperatures and to a variety of chemicals.

For NEOPRENE COMPOUNDING

MAGLITE-M*
(Magnesium Oxide)

- Better acid acceptance
- Better anti-scorch properties
- Better uncured stock life
- Safer tubing at higher die temperatures
- Faster tubing and wire covering
- Better molding characteristics
- Excellent curing aid

MAGLITE-D
All the advantages of MAGLITE-M with these added characteristics

- Higher magnesium oxide content
- Easier incorporation into neoprene
- Less dust

NAPHTHAS, AROMATIC

Produced either by hydrogenation or extraction. Differ from straight run naphthas in that they have the ability to dissolve many substances that ordinary straight run solvent naphtha will not dissolve. Used largely to dissolve synthetic resins in the formulation of enamels.

NITROGEN COMPOUNDS

Alkyl Amines, Ethylene Amines, Morpholine, Ethanolamines, Isopropanolamines, Alpha Methyl Benzyl Amines, and Acetoacetarylamides are among the nitrogen compounds commercially available from Carbide. These organic nitrogen compounds are widely used in many industries as neutralizing agents, emulsifiers, and as raw materials in the synthesis of other important chemical compounds. Many of Carbide's nitrogen compounds are shipped in tank cars, as well as in drums. For further information, write for our catalog "Aliphatic Nitrogen Compounds."

OILS, COTTON-SPRAYING

Proprietary compounds applied to cotton to condition the fibres for the mfr. of yarn and finished cloth, and at the same time improve the working conditions in the mill. Should penetrate the fibres thoroughly and uniformly, should have no detrimental effect on later bleaching and dyeing operations. Should make the fibres more flexible and thus easier to draft; should reduce static; should reduce fly, dust and shedding; prevent breakage of long fibres; produce smoother yarns; in general restore the natural oils and moisture to cotton which has been stored for long periods.

OILS, GRAPHITED

Lubricating oils which contain a relatively small percentage of graphite, usually in the colloidal form, which raises the critical temperature, thus permitting the use of smaller quantities of oil. This is desirable at high temp. where excess oil forms an excess of troublesome carbon. Less oil also entraps less dirt, reduces the fire-hazard.

OILS, HYDROGENATED

Prepared by adding additional hydrogen to oils whose molecules are unsaturated as regards hydrogen. This is done in the presence of finely divided nickel as a catalyst. The process is complex and there are many variations. Hydrogenation may be stopped at any stage, and very hard fats may be mixed with untreated oils so that any degree of hardness or softness is obtainable. The principal use for hardened oils is for cooking and in the mfr. of soap. Fish oils when hydrogenated lose most of their disagreeable odor and in this form can be used in soap kettles and also are used in paint formulation.

OILS, INK

Oils employed in ink making are classified as drying, semi-drying, and non-drying, the last being chiefly of petroleum origin. They are sometimes referred to as varnishes when in the finished state. Boiled oils dry much more rapidly than raw oils. Usually ink makers add a drier to the oil or mixture of oils.

OILS, SULFONATED

Sulfonated oils are products of the action of strong sulfuric acid on vegetable, animal, and mineral oils; also their fatty acids, and alcohols. They are available for use in a wide variety of processes in the textile, leather, metal and miscellaneous industries as follows: sulfonated castor oil, olive oil, neatsfoot oil, lard oil, rape oil, mustard seed oil, tea seed oil, sunflower oil, tallowoleic acid (red oil), cod oil, herring oil, whale oil, sperm oil, coconut oil, palm kernel oil, palm oil, degras, fatty acids of the foregoing oils, fatty alcohols, and products from mineral oil refining. U.S. Bureau of Standards defines sulfonated oils; the term "sulfonated oil" shall designate the product of interaction between a saponifiable oil or fat or its fatty acids, or a mixture of saponifiable oils or fats or their fatty acids, and sulfuric acid or similar sulfonating agent, the reaction to take place under such conditions that some or all of the oil is converted into a sulfate. With the exception of water and alkali, it shall contain no other admixture. A sulfonated oil of any particular designation shall contain no other oil or fat, except the kind designated.

OILS, TANNING

Primary function of oils in tanning operations is the lubrication of the collagen bundles, which form the large portion of the hide, so that they will not glue together resulting in a hard, brittle leather. Many oils and fats are used: tallow and oleo-stearine for stuffing harness, strap and belting leather; neutral oils such as cod, neatsfoot, castor, mineral, etc. See also Fat Liquors: Oils, Sulfonated; Tallow, Sulfonated.

OILS, TEXTILE, COTTON

Finishing oils formulated to give a finish or glaze to cotton yarns. Should not give a yellowish tinge to goods on ageing. In many instances products of this type exert an effect of leveling up shades. Should also impart to the goods a very lofty handle.

OILS, TEXTILE, SILK

Wide variety of oils employed by throwsters for softening raw silk. Olive oil, coconut oil, neatsfoot oil, sulfonated oils, and special combinations of these and other oils often with added soap are used. More recently complex organic products, such as the higher fatty alcohols, have been introduced.

OILS, THREADING

Threading operations demand a lubricant and coolant. The oils used must be so made up that great film strength is obtained, rapid penetration and spread afforded, and a decided cooling effect produced. The cutting edge which forms the thread must be kept clean and free.

when they* ask for ozone . . .

it's always

WELSBACH OZONE

for economy and efficiency

Welsbach's pioneering in ozone research has made low-cost ozone a reality . . . and that development has made "Welsbach" and "Ozone" synonymous to research men everywhere.

*research or management

In addition to its economy, Welsbach Ozone has become the oxidant of choice because of its efficiency and dependability. And a background of engineering "know-how" is available to help in solving oxidation problems in new applications of ozone . . . in servicing Welsbach Ozonators . . . and in bringing present equipment up-to-date. More than three-quarters of a century of company existence is proof that Welsbach's engineers will be ready when you want them . . . whether it is today or tomorrow. Write now for the Welsbach Ozone catalog folder.

PAINTS, CASEIN

Coatings in which casein replaces the linseed or other drying oils of ordinary paint. Casein provides the sizing property, whereas fillers supply the covering power. For indoor ornamental work, the usual fillers are lime, powdered chalk, or kaolin. For outside, lime or cement becomes the filler. The paint is prepared by mixing intimately correct proportions of casein, filler and pigment in a mill. The finished powd. is mixed with water to correct consistency when used by the consumer. Casein paints provide pleasant effects, are very durable, and with special treatment are washable.

PAINTS, DIPPING

Thin-bodied paints used in the coating of production items. These paints are generally made with varnish vehicles and pigmented with the usual material, depending upon the color required. They dry quickly and are so formulated that the body of the paint in the tank remains constant during use. Dipping Paints also vary considerably in price, depending upon the service to which they are put.

PAINTS, LUMINOUS

Special paints, formulated with luminous pigments which "glow" in the dark, find application on watch and instrument dials, door knobs, electric light pull chains, signs, etc., and wherever attention to objects in the dark is desirable, either from the artistic or safety viewpoint. Color of the luminescence can be varied and controlled within wide limits.

PAINTS, OIL-PROOF

Are made with a varnish vehicle, and are generally used for decorating machinery. Alkyd resin enamels are particularly suited for this service because of their resistance to heat and lubricating oil. Oil-proof enamels are also used for the painting of transformers which are subjected to both interior and exterior exposures, along with frequent splashing of oil.

PECTIN

Complex vegetable carbohydrate found in fruit juices. Being natural material, it is not uniform in strength. A #100 pectin would jellify 100 lbs. of sugar combined with water or juices, so as to give 65% sugar content in finished product having pH of 3.00. Standardizing is accomplished by checking finished pectin and diluting with sufficient quantity anhydrous corn sugar to give strength of above standard. For export purposes, to reduce freight and space, a #160 grade is frequently sold. Newer developments of pectin are not entirely dependent on jellying strength: for this reason it appears inadvisable to dilute with sugars, the pectin being sold in as pure state as possible, with statement of jellying strength, which might be #140, #160, #185 or possibly #200. Uses—in drug trade, quenching of steel, binder for tablets, as stabilizer, and generally where active protective colloid is desired, or where controlled viscosities are required.

PERFUMES, SOAP

Perfumes used to mask the distinctive odor of fats, and also to give a pleasing smell. Every soap, even the cheapest type of laundry soap, is perfumed. Important factors in soap perfumes are: first, cost, and second, the evaporation of perfumes so that high boiling point essential oils or synthetic aromatics, especially in soaps where the perfume is added to the soap mass while it is still molten must be used. Where the perfume of essential oils would disappear on account of their low boiling point, the use of high boiling point synthetics retains the desired perfume odor. The perfumes must not discolor the soap.

PIGMENTS, CHROMIUM

More common members of this group are: pure chrome green (a precipitated mixture of lead chromate and iron ferro and ferricyanide blue) reduced chrome green, also known as grinders' green (a mixture of lead chromate and iron ferro and ferricyanide blue precipitated on a base of barium sulfate or insol. siliceous material or any mixture thereof); chrome oxide green (a practically pure sesqui-oxide of chromium, Cr_2O_3); chrome yellow (usually mixtures of normal and basic lead chromates). Finished products are sold in the dry form or ground in oil, or in japan to form a paste. See A.S.T.M. Standard Specifications D212-27; D213-27; D263-28; D211-27. PIGMENTS, EXTENDER

Extender pigments having a wide range of chemical and physical properties are commercially available, such as the high- and low-oil-absorption precipitated calcium carbonates, diatomaceous earth, bleached silicas, and transparent water-ground mica. These, properly formulated in paints, varnishes, and lacquers produce special effects. Diatomaceous earth can be used to flat a paint or lacquer without excess pigmentation. Low-oil-absorption calcium carbonate is added to white enamels to reduce drag and improve leveling. High-oil-absorption precipitated calcium carbonates improve the dry hiding power of inside whites, and also aid in producing a dead flat effect. Transparent, white, water-ground mica, if added to a lacquer film, adds mechanical strength without affecting transparency. Mica can be used in small amounts to overcome checking and cracking of outside paints. Other extender pigments include talc, barytes, clay, slate, limestone, chalk, whiting, gypsum, Terra alba.

PIGMENTS, GREEN

Most commonly employed green pigments are: 1. Chrome Green, C.P., a combination of Prussian blue and chrome yellow, different proportions of which give a variety of tints; 2. Brunswick Green (often called Grinders), a reduced chrome green precipitated on barytes with less opacity and staining power, but greater brilliancy than chrome green, C.P.; 3. Chromium Oxide, a yellowish or sage green of good opacity, unaffected by light, heat, acids or alkalies, but somewhat dull in color; 4. Guignet's Green, permanent, stable and inert, very brilliant, but more expensive.

PIGMENTS, LUMINOUS

The principal substances that absorb rays of light and emit them in the dark are the sulfides of the alkaline earths and sulfides of zinc. The former react only feebly, zinc sulfide gives fairly intense illumination. Luminous pigments are used chiefly in the formulation of luminous paints, for stage purposes, in printing, etc.

PIGMENTS, MICA

In the paint pigment field wet-ground mica supplements as well as replaces asbestine or fibrous talc and is preferably used to the extent of 10% of the pigment. Specifications generally call for 90% ground through 325 mesh and smoothly rounded edges. If the edges are ragged, as are those of ordinary dry-ground mica, the particles will not lie on one another like fish scales or orient themselves in the plane parallel to the paint film surface. Bulky or granular particles likewise are not desired for the reason that equidimensional particles do not tend to force the paint film. Mica is claimed to be superior to fibrous materials, inasmuch as it not only tends to hold together the film as does the hair or fiber in plaster, but it also binds the film (due to the overlapping of plates like fish scales), increases its wearing qualities, and acts as a lubricant. High bulking quality (sp. gr. 3.35; wgt. per gal. 27.75; bulking, 0.0361 gal. per lb.).

PIGMENTS, PAINT

Coloring materials, insol. in the paint vehicle, but held in suspension, including lead, zinc, cadmium, titanium, mercury and chromium pigments; ochres, siennas, umbers, iron oxides, bone black, lamp black, carbon black, etc.: important factors considered in paint pigments are: particle size, bleeding, moisture, wetting and dispersing properties, neutrality, covering powers, light fastness, resistance to acids, alkalies, oil etc., oil absorption, specific gravity, and tinting strength.

PIGMENTS, PAPER

Used to improve the opacity, whiteness, and brightness of paper. Among the more common pigments employed are titanium dioxide and composites of the dioxide with blanc fixe or calcium sulfate; the three main grades of zinc sulfate pigments, namely: 1. Commercial zinc sulfate; 2. Zinc sulfide pigment containing approximately 50% blanc fixe; 3. Zinc sulfide pigment containing approximately 70% blanc fixe. Paper pigments differ from paper fillers in that the latter usually have relatively large particle size, low whitening or opacifying power, and are retained by mechanical filtration rather than by adsorption. Many of the paper pigments are added in the beater stage, others like zinc oxide in the coating operation.

PIGMENTS, RED

Most commonly used red pigments are: 1. Red oxide, the shades vary from brown (Spanish) to deep red (Persian Gulf), more brilliant shades are produced chemically with a lighter ferric content; 2. Burnt ochre; 3. Burnt Sienna; 4. Red Lead (seldom used except as a priming coat); 5. Basic Lead Chromate; 6. Vermillion (the oldest of brilliant red pigments and prepared by subliming mercury and sulfur together); 7. Cadmium Red, a compound of cadmium, sulfur, and selenium, and largely used in artists' colors.

Used to impart colors to finished rubber articles and roughly classified as chemical or mineral pigments. Mineral pigments must withstand action of sulfur in the vulcanization operation, and usually iron oxides, zinc oxides, chromium oxides, complex sulfides of antimony, cadmium, mercury, and zinc, ultramarine blue and Prussian blues, Titanium oxides, carbon black, etc., are employed. Chemical pigments are in the form of lakes, toners, dyes, etc. Specially dispersed pigments and colors are required for latex.

PIGMENTS, TITANATED LITHOPONE

Titanated lithopones widely used to increase the opacity of either flats, enamels, or exterior paints; also as beater addition or for surface application in paper making. Their thin to medium consistency permits high pigmentation at low consistencies, or their high opacity may be used to produce high-hiding finishes at low-pigment concentration.

PIGMENTS, TITANIUM

Outstanding characteristics are great hiding power, chemical inertness, stability, ability to withstand extreme conditions of exposure without alteration or discoloration. Basic raw material is ilmenite and the principal titanium pigments are Titanium Barium Pigment, Titanium Calcium Pigment, Titanium Magnesium Pigment, and Titanium Dioxide. Titanium pigments are used in the mfr. of paint, paper, oil-cloth, linoleum, textiles, ink, rubber goods, and in many other industries where white pigments are required. See also: Titanium Dioxide.

PIGMENTS, WHITE

Materials which impart a white color to paints, lacquers, rubber, oil-cloth, linoleum, enamels, paper, textiles, cosmetics, leather, etc. Most common white pigments are lithopones, titanium oxides, extended titanium pigments, barytes, titanated lithopones, zinc sulfide, zinc oxides, etc.

PIGMENTS, YELLOW

Most commonly employed yellow pigments are: 1. Chrome Yellows, varying in color from pale yellow to dark orange. They are brilliant in tone and of considerable opacity and strength of color, and are reasonably permanent; 2. Barium Chromate, pale yellow in color, and unaffected by hydrogen sulfide; 3. Zinc Chrome, pale yellow in color, but completely decomposed by acids and alkalies, but resistant to heat; 4. Yellow Oxide, artificially prepared, stronger in color than ochre, inert, and resistant to heat; 5. Cadmium Yellow, which is a sulfide of cadmium, durable, and lightproof; 6. Yellow ochres; 7. Siennas.

PIGMENTS, ZINC

Principal members of this group are: 1. Zinc oxides, sometimes known as "Zinc White" and produced by the American process direct from the ore, or by the French process from spelter. Available in the dry form or ground in oil to form a paste; 2. The leaded zinc oxides; 3. Zinc Sulfide in either the dry pigment or ground in oil; 4. Lithopone, a combination of zinc sulfide and barium sulfate, also available in the dry or paste form. See A.S.T.M. Standard Specifications. D79-24: D80-25; D386-36; D385-36. See also: Lithopone, Zinc Oxide, Zinc Sulfide.

PLASTICIZERS

FLEXOL plasticizers DOP, CC-55, 3GH, 3GO, 4GO, TOF, 8N8, TWS, A-26, R-2H, and B-400 are designed to meet industry's plasticizer needs for vinyl plastics, cellulose ester coatings, and synthetic rubber compounds. They have good general characteristics, such as compatibility and low volatility. In addition, every FLEXOL plasticizer is outstanding in contributing one or more special properties: low temperature flexibility, resilience, high impact strength, cold check resistance, workability, or resistance to oil and water extraction. Specific performance characteristics can be incorporated in compounds by blending these plasticizers.
